Name 5 different Bootstrap components and describe how they work.

- Dropdowns
  - these are the toggle-based menus that list a list of links.
- Button groups
  - you can group a set of buttons together in a series adjacent to each other.
- Button dropdowns
  - is used to employ a button element to trigger a dropdown
- Input groups
  - this extends the form-control class and adds text or buttons at either side of an input field of an input element
- Navbar
  - these components serve as the navigation headers for your website.

How does the Bootstrap grid system work?
The Boostrap grid system works by uses containers, rows, and a max value of 12 columns. Anything over 12 will start a new row. It follows the mobile-first strategy so that it can fit on very small to very large screens by condensing or expanding it's size for the best view.

What is your favorite thing you learned this week?
I enjoyed the cleanliness of Bootstrap. It is visually appealing and makes creating pages easier than starting with fresh CSS for every page. It saves you from recreating the "wheel"
